

# SECUREAUTH IDP IS NOW THE SECUREAUTH® IDENTITY PLATFORM

New release brings deployment freedom, simple administration, and enhanced security

## Key Enhancements Details

### Deployment Freedom

We know most enterprises are not solely cloud or solely on-prem. That's why with the SecureAuth Identity Platform you get the same capabilities regardless how you deploy — hybrid, on-prem, or cloud. Gain the freedom to choose without compromising functionality. The Identity Platform ensures you meet your identity and access management requirements today and have the flexibility to evolve in the future.

### Key Enhancements At-a-Glance

- + **Deployment Freedom** — deploy any way you want - hybrid, on-prem, cloud
- + **Simple Administration** — reduce administration time with reusable & centralized global authentication settings and policies
- + **Enhanced Security** — gain greater security and less user disruptions with biometric multi-factor authentication (MFA) using fingerprint or facial recognition, a unique dynamic perimeter policy check, and the SecureAuth® Intelligent Identity Cloud, a cloud-based analytics engine that delivers continually updated identity intelligence.

### Simple Administration

The SecureAuth Identity Platform approach to administration leverages reusable objects and settings to simplify and accelerate the creation and administration of authentication experiences. In this release, we introduce reusable adaptive authentication objects and global multi-factor authentication (MFA) settings.

Reusable adaptive authentication objects enable you to build policies using any number of SecureAuth risk checks. You can then apply these centralized policies across as many systems as desired.

Global MFA settings work similarly. You can now centrally manage these settings (e.g. OTP length, timeout length, methods deployed), to ensure adherence to your policies across any number of systems.

When changes are needed, modifications are made centrally and auto-propagated across your environment. This approach centralizes policies for standardization, simplifies set up and ongoing administration, and delivers a more consistent experience for workforce and customer identities.

Our *Identity Security Intelligence* dashboard brings out-of-the-box reporting of key metrics about your identity security status. (e.g. number of logins; login by system; successful vs failed logins; MFA methods used; and more). This dashboard updates when the page is refreshed, providing analysts with security intelligence at the push of a button.

Also, in this release is a new end-user theme that is easily customizable. Change backgrounds, add logos, and modify the position of fields easily with cascading style sheets (CSS).

## Enhanced Security

We continue to invest in securing identities, always seeking new ways to deliver strong access security combined with engaging user experiences. In this release, we introduce biometric MFA support. Take advantage of fingerprint and facial recognition capabilities for greater security, especially in passwordless scenarios.

We are also unveiling a unique dynamic perimeter risk check. With dynamic perimeter, users are not burdened with MFA disruptions after they have successfully authenticated and not traveled outside of a customer-defined perimeter (e.g. 50 miles) for a specified time period. This new feature is ideal for removing authentication disruptions for users who regularly move about in campus-like environments.

## Boost security with intelligence.

The SecureAuth® Intelligent Identity Cloud brings cloud-based analytics and administration that employs a big-data approach delivering the identity intelligence and risk checks required to ensure strong security and maximum usability for all your identities.
